

MO DESCRIPTION OF A POLAR COVALENT BOND

ASSIGNMENT OF FORMAL CHARGES

COUNT THE NUMBER OF VALENCE ELECTRONS FOR A GIVEN ATOM. LONE PAIRS ARE COUNTED AS TWO VALENCE ELECTRONS; EACH COVALENT BOND IS COUNTED AS ONE VALENCE ELECTRON.

$$\text{FORMAL CHARGE} = \# \left(\text{OE VALENCE ELECTRONS FREE ATOM} \right) - \# \left(\text{OE VALENCE ELECTRONS PROVIDED ATOM} \right)$$

EXAMPLE

OZONE

DMSO

NITRO FUNCTIONAL GROUP

$$\begin{aligned} 6 - 6 &= 0 \\ 6 - 7 &= -1 \\ 5 - 4 &= +1 \end{aligned}$$

RESONANCE

AND THE
ARROW-PUSHING
CONVENTION

BENZENE

- ① DOUBLE-HEADED ARROW INDICATES THAT THE COMPOUNDS ARE RESONANCE FORMS

CARBOXYLATE

NITRO

RULES FOR RESONANCE STRUCTURE

- ① EACH INDIVIDUAL FORM IS A (FLAWED) REPRESENTATION OF THE TRUE STRUCTURE.
- ② RESONANCE FORMS ONLY IN THE POSITION OF π OR NONBONDING ELECTRONS, NOT POSITIONS OR HYBRIDIZATION OF ATOMS.
- ③ DIFFERENT RESONANCE FORMS NEED NOT BE EQUIVALENT.
- ④ RESONANCE FORMS OBEY NORMAL RULES OF VALENCY
- ⑤ THE RESONANCE HYBRID IS MORE STABLE THAN ANY INDIVIDUAL RESONANCE STRUCTURE.

RESONANCE AND HYBRIDIZATION IN AMIDES
