## CSCI48: ASSERTS & LOOP INVARIANTS

### LOOP INVARIANTS

EXAMPLE: INSERTION SORT

```
WHILE  $i \neq \text{len}(L)$   
  ASSERT  $L[:i] = \text{sorted}(L[:i])$ 
```

LOOP INVARIANTS ALLOW TO INTRODUCE  
A FORM OF CHECKPOINTS, BREAKING THE  
FLOW ON THE BREACH OF THE INVARIANT.

NOTE SOME ASSERTS ARE SLOW.  
IT IS POSSIBLE, HOWEVER,  
TO RUN THE CODE WHILE  
IGNORING ASSERTS.

### CHOOSING TEST CASES

NOTE THAT  
CHOOSING  
CHARACTERISTIC  
PROPERTIES  
IS MORE  
IMPORTANT  
THAN CHOOSING  
TEST CASES

INITIAL CHOSEN  
PROPERTIES,  
HOWEVER,  
OFTEN DO  
NOT DEFINE  
THE PARTITION  
WITHOUT OVERLAP

### DIVIDE AND CONQUER

- ① IDENTIFY THE PROPERTIES  
OF INPUTS WHICH  
SORT THEM INTO EQUIVALENCE  
CLASSES.
- ② VERIFY THE CODE WORKS  
FOR THESE CHARACTERISTIC  
TEST CASES
